

## HTML FORM

**Q1) What are HTML forms used for? Describe the purpose of the input, textarea, select, and button elements.**

HTML forms are used to collect data from users (like login, sign-up, feedback).

**<input>** is for short answers.

**<textarea>** is for long text.

**<select>** is for dropdown choices.

**<button>** is for submitting or resetting the form.

**Q2) Explain the difference between the GET and POST methods in form submission. When should each be used?**

GET sends data in the URL, visible to everyone. It's used for searching (e.g., Google search). POST sends data hidden in the body, safer for passwords or personal info, and is used for login or payments.

**Q2)What is the purpose of the label element in a form, and how does it improve accessibility?**

The <label> element gives a name or title to form controls (like input boxes). It improves accessibility because screen readers can read the label for blind users.
