

Wd-HTML5

Q1) Difference between HTML & HTML5

- HTML is the older version used to make web pages, but HTML5 is the latest version with more features.
- In HTML, we could not play video or audio directly; we needed extra software like Flash. In HTML5, we can use <video> and <audio> tags easily.
- HTML5 gives new tags like <header>, <footer>, <article> that make web pages more meaningful.
- HTML5 works better on mobile phones and supports offline storage also.

Q2)What are the additional tags used in HTML5?

HTML5 added many new tags like:

- <header> and <footer> → for top and bottom part of page.
- <nav> → for menu and navigation links.
- <audio> and <video> → to play music and videos.
- <canvas> and <svg> → to draw shapes and graphics..
